ANALYTICAL RESULTS REPORT
FOR RICHARDSON FLAT TAILINGS
PARK CITY, UTAH
TDD #R8-8608-05

I. INTRODUCTION

This report was prepared to satisfy the requirements of Technical Directive Document (TDD) R8-8608-05 issued to Ecology and Environment's Field Investigation Team (E&E FIT) by Region VIII Environmental Protection Agency (EPA). This report addresses the analytical results for the air sampling activities conducted at the Richardson Flat Tailings site in Park City, Utah. FIT members conducting the air sampling during July 7-14, 1986 were Henry Schmelzer and Dave Franzen. Sampling procedures used in this investigation conform to the Region VIII FIT SOP for Hi-Vol Air Sampling at Hazardous Waste Site; the Quality Assurance Handbook for Air Pollution Measurement Systems, Volume II - Ambient Air Specific Methods; EPA-600/4-77-027A, May, 1977, U.S. EPA, Research Triangle Park, N.C.; and 40 CFR Part 58, July, 1983.

The overall scope of the project involved the set up and operation of a total of five high volume (hi-vol) air samplers at four sampling locations over a five day period. A total of twenty-nine samples were collected including four duplicates and five blanks. Site access was set up by Sue Kennedy of Ecology and Environment, and Kelcey Land and Matt Cohn of Region VIII EPA.

The objectives of this investigation were to determine if the migration of heavy metal contaminated suspended particulate matter exists and to further substantiate and complete the HRS air route score. This score was previously based on photo-documentation of wind blown tailings material.

On June 20, 1985, clouds of fugitive dust moving offsite as a result of strong winds from the west-northwest were photographed by the original EPA-FIT team doing the site investigation. Results of analyses of surface tailings samples showed concentrations as high as 3,600 ppm arsenic, 80 ppm cadmium, 8,530 ppm lead, and 6,360 ppm zinc. Mean soil concentrations for those metals in the western U.S. respectively are 5.5 ppm, 0.2 ppm, 17 ppm, and 55 ppm (Shacklette, 1984).

IV. METEOROLOGY

The Richardson Flat tailings lie in a small flat topographic basin of approximately 800 acres. The configuration of the basin was expected to have a pronounced effect on local air flow. The basin is situated at 6600 feet elevation and is surrounded by ridges of the Wasatch Mountains that range from 6700 feet to 7600 feet. Silver Creek enters the basin from the west-southwest then angles to the north. Daytime up valley air flows were anticipated to originate from the west northwest. This was found to be the case.

The data presented in the following section was acquired from The Climatic Atlas of the United States, U.S. Department of Commerce, Environmental Sciences Services Administration, Environmental Data Service, June 1968. The climate of the Park City area is characterized by moderate fluctuations in temperature and precipitation throughout the year. Mean monthly temperatures range from 10 degrees Fahrenheit ($^{\circ}$ F) in December, January, and February to 80 $^{\circ}$ F in June, July and August. During the month of July the average temperature is approximately 60 $^{\circ}$ F. Precipitation for the Park City area varies from a mean monthly amount of 1.00 inches in July to 2.22 inches in December. Prevailing wind direction at Park City is typically from a southeasterly direction throughout the year. Relative humidity for the Park City area varies from 40 percent in August to 80 percent in December and February. The average relative humidity in July is 50 percent. Barometric pressure ranges from 1022 millibars (30.18 inches of mercury) in December and January to approximately 1010 millibars (29.83 inches of mercury) in June.

VI. QUALITY ASSURANCE

The air samples were analyzed for arsenic, cadmium, lead and zinc only. Soil samples were analyzed for Task 1 and 2 metals. The inorganic analytical data were examined thoroughly for compliance with contract laboratory program quality assurance criteria. The data were found to be of good quality. In the air samples, spike recoveries for cadmium and zinc were 65% and 60% respectively and actual values in the tables may be higher than presented. The analytical results for lead in soils were also of good quality. Duplicates showed good agreement. A blank was submitted for each sampling day. The quality assurance reports and raw data are shown in Appendix II.

VII. ANALYTICAL RESULTS

The results of the inorganic analyses are noted in Table 1. Sample locations are noted in Figure 2.

Formulas used for determining the airborne concentrations are presented along with an explanation of terms with Table 2. Table 2 shows the calculations used to determine the total volume of air sampled corrected to standard conditions by each sampler on each sampling day. This information was used to create Table 3 which contains the average concentration per cubic meter for each of the four elements of concern. When combined with the wind speed and direction information from Figures 4-13, offsite migration of the contaminants can be determined. Table 4 shows the field increases for each days samples comparing upwind and downwind concentrations and downwind versus the remote background. Table 5 shows the Task 1 and 2 metal concentration in soils by the two major roadways by the site.

predominant winds are from the WNW and NW with 25% and 18% of the wind respectively from those vectors. The sample period started with light and variable winds from 0-10 mph. At 1430, the wind increased to 10-20 mph and stabilized from the WNW. At 1800 hours the wind dropped back to 5-10 mph and at 2000 the wind went calm and continued that way until the sample period ended.

Based on the wind rose, the upwind sample location would be AM-04 and the downwind location would be AM-02. Comparing upwind versus downwind sample locations reveals an 11 fold increase in lead, a 5 fold increase in zinc, and 7 fold increase in arsenic.

DAY 3

The sample period began at 1100 hours on July 10th and continued until 2300 hours. Figure 6 shows the wind rose for the site for this period of time. The predominant wind direction is WNW with 69% of the wind for this time period from that direction. Based on the wind rose and sampler locations, the upwind sampler would be AM-04 and the downwind location would be AM-02.

The wind at the start of the sampling period was from the NNW at 5-10 mph. At 1045, the wind picked up to 10-20 mph from the WNW and continued so until 1800 hours when the wind slowed to 5-10 and then went calm at 2000 hours.

Results from Table 4 show a 9 fold increase in lead, a three fold increase in zinc, a ten fold increase in arsenic and a two fold increase in cadmium when comparing upgradient versus downgradient.

DAY 4

Sampling was initiated at 1000 hours and continued until 2300 hours. Figure 7 shows the wind rose for this sampling period. The predominant wind direction is WNW with 55% of the sampling time followed by NW with 10%. Based on this information, the upgradient sample location is AM-04 and the downgradient is AM-02.

AM-01 to AM-04 there is a 3.5 fold increase in lead, 1.3 fold increase in zinc, and a 1.5 fold increase in arsenic at sample location AM-04. Comparing AM-05 to AM-01 there is a 2.4 fold increase in lead, a 1.5 fold increase in zinc, a 1.2 fold increase in arsenic and a 1.25 fold increase in cadmium at sample location AM-05.

Five soil samples were also taken on this day. The results are shown in Table 5. Of principle concern was the potential for interference with lead from vehicle emissions along U.S. 40 and the county road. Deposition of lead from vehicle emissions is most pronounced within the first 15 meters of the roadway. (40 CFR, Part 58, Appendix E, 7.3 and Daines, 1970). The samples taken 2 feet off of the asphalt edge of the roadway on U.S. 40 and the county road show lead at 477 and 418 mg/kg concentrations respectively. At 10 feet from the county road the concentration drops to 133 mg/kg. At 50 feet from U.S. 40 the concentration is 13 mg/kg which is within the range of the average lead in soil concentration for the Western U.S. of 9-3' mg/kg (Shacklette, 1984).

The air sampling location nearest to either U.S. 40 or the county road is over 200 yards. The concentration of lead in the tailings is 8530 mg/kg and the samplers were placed next to the tailings. Hence, based on the soil sampling and the air station placement, lead from vehicle emissions is not likely to be a major contributing factor to lead deposition in the air samples.

Sample S0-5, intended to be a background soil sample, was deemed unusable for comparison purposes due to elevated lead content.

j Matrix spike recovery was 65% for cadmium. Actual value may be higher. Duplicate relative percent of differences were out of CLP criteria for zinc.

r Matrix spike recovery for zinc was 60%. Values given are estimates.

EXPLANATION OF TABLE 2

FORMULAS:

$$\frac{Q_{std}}{CFM} = \frac{QR}{CFM} \times \frac{Pa \text{ in Hg} \times 25.4}{TaK} \times \frac{298K (T_{std})}{760mm(P_{std})} \\ \text{of Hg}$$

$$\frac{\text{Vol. std m}^3}{\text{CFM}} = t \text{min} \times \frac{Q_{std}}{35.32}$$

QRI CFM = Initial flow rate in cubic feet per minute.

QRF CFM = Final flow rate in cubic feet per minute.

QR CFM = Average flow rate in cubic feet per minute.

Ti F = Initial temperature in degrees Fahrenheit.

Tf F = Final temperature in degrees Fahrenheit.

Ta K = Average temperature converted to degrees Kelvin.

Pa in. Hg = average barometric pressure in inches of mercury.

Qstd CFM = Flow rate in cubic feet per minute at standard temperature and pressure.

t min = Total time in minutes that sampler ran.

Vol. std m³ = Total volume of air sampled in cubic meters at standard temperature and pressure..

() Data are unacceptable

Action required by DPO?

No Yes ✓ Following items require action Detection limits
requested by region were not met by the laboratory.
Lab should resubmit furnace results with RSD values. **
Action required by Project Officer (PO)?

No Yes

** See Appendix V, Point 2, for clarification.

Following are our findings:

Cellulose acetate filters were submitted for analyses of arsenic, aluminum, lead and zinc. This was a SAS request.

The spike recovery for cadmium was 65%, the cadmium results, therefore, have been flagged with an "R". The zinc Laboratory Control Sample recovery result was only 60%. The zinc results may be biased low and have been flagged as estimated (S).

Two aspects of the contract were not fulfilled by the laboratory. Detection limits of 1 mg/l were specified in the SAS contract. However, the actual instrument detection limits for As Cd, Pb and Zn were from 3.8 - 4.8 ug/l. Also, the RSD results for duplicate furnace injections were not reported. The duplicate results appear to agree well, however.

Zn was analyzed by ICP, Region 8 and SMD approved this method change 8-13-86.

ICP Interelement and background corrections applied? Yes X No .

If yes, corrections applied before X or after generation of raw data.

Footnotes:

N - not required by contract at this time

Form I:

V - If the result is a value greater than or equal to the instrument detection limit but less than the contract required detection limit, report the value in brackets (i.e., [10]). Indicate the analytical method used with P (for ICP/Flame AA) or F (for furnace).

U - Indicates element was analyzed for but not detected. Report with the detection limit value (e.g., 10U).

E - Indicates a value estimated or not reported due to the presence of interference. Explanatory note included on cover page.

S - Indicates value determined by Method of Standard Addition.

R - Indicates spike sample recovery is not within control limits.

D - Indicates duplicate analysis is not within control limits.

C - Indicates the correlation coefficient for method of standard addition is less than 0.995

Data are acceptable for use

Data are acceptable for use with qualification noted ^{below} above

Data are preliminary - pending action or verification

Data are unacceptable

Action required by DPO?

No Yes Following items require action _____

Action required by Project Officer (PO)?

No Yes

Following are our findings:

The As, Hg, Sb, S- and Tl results are flagged with m R due to spike recoveries beyond $\pm 10 \pm 2$ % control limits. The As, Hg and Tl matrix spike recoveries are very high, this may indicate a positive bias. The duplicate RPD results for Cr, Al, Ca, Mg, Hg and Zn was between 39 and 61%. These results should be considered quantitative estimates. The serial dilution results for Be, Co, K, Sb and V indicate that an interference may be present for these elements.

The laboratory submitted corrected Form I's because they had originally miscalculated the matrix spike recoveries. The new Form I's are different to read and confusing.

FORM A
Inorganic Data Completeness Checklist

- Inorganic analysis data sheets
- Initial calibration and calibration verification results
- Continuing calibration verification
- Instrument Detection limits
- Duplicate results
- Spike results
- ICP interference check sample
- Blank results
- Serial Dilution Results
- Raw data for calibration standards
- Raw data for blanks
- Raw data for samples
- Raw data for duplicates
- Raw data for spikes
- Raw data for furnace AA
- Percent solids calculation - soils only
- Traffic Reports

FORM B

Initial calibration data were reviewed. Initial calibration data were included in the package and met all contract requirements.

YES NO

Comments:

Continuing calibration data were reviewed and these data met all contract requirements.

YES NO

Comments:

A blank was run with every twenty samples or less per case.

YES NO

Comments:

How many elements were detected above the required detection limit? 0

How many elements were detected at greater than one half the amount detected in any sample? 0

Comments:

FORM C

The interference check sample was run twice per eight hour shift. No massive interferences were present.

YES _____ NO

Comments:

Final ICS for antimony was not analyzed

All matrix spike requirements were met.

YES _____ NO

Comments:

As 280% 56 67%

Hg 150%

Se 55%

Tl 218%

As, Hg & Tl results may be biased high.

N flag applied to results.

Laboratory miscalculated spike recoveries and submitted new forms.
A duplicate sample was run with every twenty or fewer samples of a similar matrix, or one per case, whichever is more frequent.

YES NO _____

Cr 61% RPD

Al 39%

Ca 56%

Mg 58%

Hg 57%

Zn 42% ↓

Limit - 35 RPD

* flag applied

The RPD's were tabulated.

YES NO _____

Comments:

All inorganic detection limits met the contract requirements.

YES NO _____

Comments:

FORM D

All Laboratory Control Samples met specified contract limits.

YES NO

Comments:

Serial Dilution requirements were met.

YES NO

Results > 10%
Sb 34% V 68%
Co 14% Be 12%
K 15%

E flag applied
Laboratory did not flag data.

The Furnace Atomic Absorption Analysis Scheme was followed correctly.

YES NO

All holding times were met.

YES NO

INORGANIC ANALYSES DATA PACKAGE

Lab Name HITTMAN EBASCO ASSOC. INC.

Case No. 6218

SOW No. 7/85

Q.C. Report No. 55

Lab Receipt Date 7/16/86

Sample Numbers

Comments: # same as EPA#. CV - cold vapor

Sb - furnace spike levels used for ICAP analysis, ICS (final) not run. Analyst will be more careful in the future.

ICP interelement and background corrections applied? Yes No

If yes, corrections applied before or after generation of raw data.

Footnotes:

NR - Not required by contract at this time

Form Li

Value - If the result is a value greater than or equal to the instrument detection limit but less than the contract-required detection limit, report the value in brackets (i.e., [10]). Indicate the analytical method used with P (for ICP), A (for Flame AA) or F (for Furnace AA).

U - Indicates element was analyzed for but not detected. Report with the instrument detection limit value (e.g., 10U).

E - Indicates a value estimated or not reported due to the presence of interference. Explanatory note included on cover page.

- Indicates value determined by Method of Standard Addition.

N - Indicates spike sample recovery is not within control limit

* - Indicates duplicate analysis is not within control limits.

- + - Indicates the correlation coefficient for method of standard addition is less than 0.995

M - Indicates duplicate injection results exceeded control limits.

**POTENTIAL HAZARDOUS WASTE SITE
SITE INSPECTION REPORT**
PART 3 - DESCRIPTION OF HAZARDOUS CONDITIONS AND INCIDENTS

L IDENTIFICATION	
01 STATE UT	02 SITE NUMBER D980952840

II. HAZARDOUS CONDITIONS AND INCIDENTS

01 A. GROUNDWATER CONTAMINATION

03 POPULATION POTENTIALLY AFFECTED: 8

02 OBSERVED (DATE 8/2/85)

POTENTIAL

ALLEGED

Ground water samples from UPCM wells (RF-GW-2, RF-GW-3) were collected and analyzed. Dissolved metals analyses revealed elevated levels of arsenic, cobalt, iron, manganese, and zinc. Two domestic wells (210' and 222' deep) have been identified within one mile of the site.⁴ The best information available indicates the wells are completed in Tertiary volcanic rock composed primarily of andesitic pyroclastics. Whether water-bearing units of unconsolidated deposits are hydraulically connected to underlying water-bearing unit of tertiary origin is not known.

01 B. SURFACE WATER CONTAMINATION

03 POPULATION POTENTIALLY AFFECTED: 414

02 OBSERVED (DATE 6/20/85)

POTENTIAL

ALLEGED

Surface water samples from Silver Creek, collected downgradient of the site, contained elevated levels of lead. RT-SW-3 (downgradient) contained 1985 ug/l lead as compared to RT-SW-1 (upgradient) containing 147 ug/l lead. Arsenic levels were also elevated. Water diverted from Silver Creek is used for pasture-land irrigation (276 acres) within 3-stream miles of the site.⁵

01 C. CONTAMINATION OF AIR

03 POPULATION POTENTIALLY AFFECTED: 4500

02 OBSERVED (DATE 7/7/86)

POTENTIAL

ALLEGED

Hi-volume air sampling performed on July 7-14, 1986 verified the release of inorganic contaminants to the air route. A 100 fold increase in airborne lead concentration was detected when comparing upwind versus downwind sampling stations. Values for arsenic, cadmium and zinc are also highly elevated over the background samples.⁶ Population residing within a 4-mile radius is approximately 4500.⁸

01 D. FIRE/EXPLOSIVE CONDITIONS

03 POPULATION POTENTIALLY AFFECTED: 0

02 OBSERVED (DATE: _____)

POTENTIAL

ALLEGED

No recorded history -- fire and explosive conditions do not exist at the site.

01 E. DIRECT CONTACT

03 POPULATION POTENTIALLY AFFECTED: 4500

02 OBSERVED (DATE: _____)

POTENTIAL

ALLEGED

The site is not secured from public access or access by domestic livestock. On June 19 and 20, vehicles were observed driving near the tailings area along the access road. Sheep and cattle were observed walking on the tailings on June 19 and 20, 1985.

01 F. CONTAMINATION OF SOIL

03 AREA POTENTIALLY AFFECTED: 640

02 OBSERVED (DATE 8/2/85)

POTENTIAL

ALLEGED

Soil beneath the the tailings (RF-SS-6) contains elevated concentrations of antimony, arsenic, cadmium, copper, lead, magnesium, mercury, silver, sodium and zinc. Off site surface soil (RT-SO-1) contained elevated levels of arsenic, cadmium, lead, mercury and zinc probably due to wind deposition.²

01 G. DRINKING WATER CONTAMINATION

03 POPULATION POTENTIALLY AFFECTED: 8

02 OBSERVED (DATE: _____)

POTENTIAL

ALLEGED

Two domestic wells are located within one mile of the tailings.⁴ Surface water from Silver Creek is not used for drinking water.⁹

01 H. WORKER EXPOSURE/INJURY

03 WORKERS POTENTIALLY AFFECTED: 5

02 OBSERVED (DATE: _____)

POTENTIAL

ALLEGED

The tailings are being removed by Mr. Ray Wortley to be used as backfill for sewer lines and road base. In addition, FIT members observed heavy equipment operators dumping what appeared to be native soil on the tailings area. Observations were made on June 19 and 20, 1985.

01 I. POPULATION EXPOSURE/INJURY

03 POPULATION POTENTIALLY AFFECTED: 4500

02 OBSERVED (DATE: _____)

POTENTIAL

ALLEGED

No recorded history of population exposure or injury, however, the site is not secured from public access or domestic livestock grazing. Population exposure of concern include airborne contaminants, food chain contamination associated with the surface water route, and threat to domestic wells.

**POTENTIAL HAZARDOUS WASTE SITE
SITE INSPECTION REPORT
PART 3 - DESCRIPTION OF HAZARDOUS CONDITIONS AND INCIDENTS**

I. IDENTIFICATION	
01 STATE	02 SITE NUMBER
UT	D980952840

II. HAZARDOUS CONDITIONS AND INCIDENTS (Continued)

01 <input checked="" type="checkbox"/> J. DAMAGE TO FLORA 04 NARRATIVE DESCRIPTION	02 <input checked="" type="checkbox"/> OBSERVED (DATE: 6/19/85) <input type="checkbox"/> POTENTIAL <input type="checkbox"/> ALLEGED
Peripheral tailings support vegetation including <u>Juncus</u> sp., <u>Salix</u> sp. and <u>Verbascum thapsus</u> , but most of the tailings are denuded due to high levels of soluble salts and metals.	
01 <input checked="" type="checkbox"/> K. DAMAGE TO FAUNA 04 NARRATIVE DESCRIPTION (INCLUDE NAMES/ OF SPECIES)	02 <input type="checkbox"/> OBSERVED (DATE: _____) <input checked="" type="checkbox"/> POTENTIAL <input type="checkbox"/> ALLEGED
No apparent damage to area fauna. Two muskrats were observed swimming in the drainage ditch on site (near RT-SW-4). Fish in Silver Creek could potentially be affected by lead and arsenic released from the tailings.	
01 <input checked="" type="checkbox"/> L. CONTAMINATION OF FOOD CHAIN 04 NARRATIVE DESCRIPTION	02 <input type="checkbox"/> OBSERVED (DATE: _____) <input checked="" type="checkbox"/> POTENTIAL <input type="checkbox"/> ALLEGED
The possibility exists for metals to move through the food chain 1) by domestic livestock grazing in areas where soil is contaminated; 2) by heavy metal concentration in local fish populations.	
01 <input checked="" type="checkbox"/> M. UNSTABLE CONTAINMENT OF WASTES <small>(Soils runoff Standing waters. Leaking drums.)</small> 03 POPULATION POTENTIALLY AFFECTED: 4500	02 <input type="checkbox"/> OBSERVED (DATE: _____) <input type="checkbox"/> POTENTIAL <input type="checkbox"/> ALLEGED 04 NARRATIVE DESCRIPTION
Tailings ponds are uncovered and therefore susceptible to gusty winds which carry fine-grain tailings material off-site. A dam constructed at the northwest end of the tailings prevents mass movement of solid material off-site.	
01 <input checked="" type="checkbox"/> N. DAMAGE TO OFFSITE PROPERTY 04 NARRATIVE DESCRIPTION	02 <input type="checkbox"/> OBSERVED (DATE: _____) <input checked="" type="checkbox"/> POTENTIAL <input type="checkbox"/> ALLEGED
The potential exists for damage to off-site property because the tailings material is allegedly being used as sewer line backfill and road base in the Park City area.	
01 <input checked="" type="checkbox"/> O. CONTAMINATION OF SEWERS, STORM DRAINS, WWTPs 04 NARRATIVE DESCRIPTION	02 <input type="checkbox"/> OBSERVED (DATE: _____) <input checked="" type="checkbox"/> POTENTIAL <input type="checkbox"/> ALLEGED
If tailings material is being used as sewer line backfill, the potential exists for sewer contamination by metals.	
01 <input type="checkbox"/> P. ILLEGAL/UNAUTHORIZED DUMPING 04 NARRATIVE DESCRIPTION	02 <input type="checkbox"/> OBSERVED (DATE: _____) <input type="checkbox"/> POTENTIAL <input type="checkbox"/> ALLEGED
Dumping of native soil on to the tailings was observed by FIT members, but is under the supervision of United Park City Mines.	
05 DESCRIPTION OF ANY OTHER KNOWN, POTENTIAL, OR ALLEGED HAZARDS	
No other hazards are known.

07 COMMENTS

Slurry, generated from milling activities, was piped to the Richardson Flat area and currently covers approximately 160 acres. The metal sulfide, and carbonate-containing tailings material is presently a solid matrix. An ephemeral pond overlies a portion of the tailings.

IV. CONTAINMENT

01 CONTAINMENT OF WASTES <small>(Check one)</small>			
<input type="checkbox"/> A. ADEQUATE, SECURE	<input type="checkbox"/> B. MODERATE	<input checked="" type="checkbox"/> C. INADEQUATE, POOR	<input type="checkbox"/> D. INSECURE, UNSOUND, DANGEROUS

02 DESCRIPTION OF DRUMS, DIKING, LINERS, BARRIERS, ETC.

A dam at the northwest extension of the tailings is the only form of artificial containment on site. The tailings material is uncovered, and no underlying liner is present.

V. ACCESSIBILITY

01 WASTE EASILY ACCESSIBLE: YES NO

02 COMMENTS

The site is not secured from public access or domestic livestock grazing.

VI. SOURCES OF INFORMATION (Cite specific references, e.g. state files, sample analysis, reports)

DATE : August 24, 1987
SUBJECT: Transmittal of Revised Analytical Results Report of Air Sampling at Richardson Flat Tailings, TDD R8-8608-05.

Attached is the revised Analytical Results Report of Air Sampling at Richardson Flat Tailings, TDD R8-8608-05. In response to Utah Bureau of Solid and Hazardous Waste comments on the Air ARR, dated February 24, 1987 (attached), the following adjustments have been made.

1. Table 3 has been amended to include data qualifiers.
2. Because the laboratory was required by contract to provide IDL (instrument detection limit) data in units of $\mu\text{g}/\text{filter}$, and did not, reference to "pending action or verification" was made in the SAS validation package. Appropriate unit conversions were made by FIT during the development of Tables 1 through 4 of the Air ARR. Secondly, the lab failed to include % RSD (relative standard deviation) values as required by contract. The values would further substantiate close agreement of duplicate sample results, but would not change data validity or interpretation.
3. The Site Inspection form has been updated based on current information.

If you have any questions or comments, please call me at 757-4984.

Paula
Dear Ms. Schmittdiehl:

The following are the State's comments on the Analytical Results of Air Sampling, Richardson Flat, Park City, Utah. EPA verbally requested that these comments be prepared on February 19, 1987.

*EPA
should
have
copy of this
as well as response.*

The majority of the State's comments on the sampling effort were prepared on December 30, 1986 in response to the Sampling Activities Report. These comments remain valid and are attached. Additional State comments follow.

Text

- Table 3 of the text should have the same data qualifiers as Table 1.
- The data in Table 3 imply that the airborne concentrations of contaminants are at the laboratory's detection limit for analyses where the analyte was undetected. This portrayal is misleading.
- The SAS data validation package states that the air data is preliminary, pending action or verification. Has the action or verification been performed?

SI Form

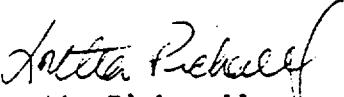

- No population figures are given for ground water, direct contact, drinking water contamination, worker exposure/injury, population exposure/injury, or unstable containment of wastes.
- The NPDES permit cited in Part 4 of the SI form is for the Ontario Tunnel. The Richardson Flat site is not permitted for discharge.

Paula Schmittiel
February 24, 1987
Page 2

- The Silver Creek drainage just below the tailings dam is an important wetlands resource. The SI form, Part 5, should be updated to reflect this.
- The demographics section of Part 5 should be updated to reflect the recent construction at Prospector Square.
- While annually there is negative net precipitation at the site, there is positive net precipitation during the winter months.

If you have any questions regarding these comments, please call John Trepanowski of my staff at (801) 538-6170.

Respectfully yours,

Loretta Pickrell
